---

Does 90% efficacy imply perfect protection in 90% of people and no protection in 10% ("all-or-nothing") or that the per-exposure risk is reduced by 90% in all vaccinated individuals ("leaky") or somewhere in ...

We find that the difference in population-level impact between all-or-nothing and leaky vaccines can be substantial when  $R_0$  is higher, vaccines efficacy is intermediate, and vaccines slow ...

We propose an estimator of VE per exposure that accounts for heterogeneous susceptibility and exposure for a repeated measures study with binary recurrent outcomes. The estimator requires only ...

Using multiple experimental and modeling approaches, we show that rainbow trout have relatively homogeneous susceptibility to infection with infectious hematopoietic necrosis virus and ...

Distinguishing the epidemiological mode of action of vaccination is important because an all-or-nothing vaccine has a greater impact in reducing population-wide pathogen transmission than a leaky ...

In this section, we construct the per-contact V E estimators  $bv$  and its 95% confidence intervals (CIs) using the Cox-based estimator  $v^*$ , derived from the ChAdOx1 nCoV-2019 (Oxford-AstraZeneca) ...
