---

The world has reached "a global irreversible solar tipping point" at which point solar will become the most efficient and cost-effective form of electricity generation over the coming years, a...

Positive tipping points have already been crossed in solar PV and wind power globally, and in the adoption of electric vehicles, battery storage and ...

Tipping points have been defined as "the point or threshold at which small quantitative changes in the system trigger a non-linear change process that is driven by system-internal feedback ...

Installed solar power is doubling every two to three years, and in many places, it now makes economic sense to shut down fossil-fuelled power ...

The evidence supports a decisive tipping point in electricity: renewables are set to become the dominant source of generation within a year or two in several scenarios, driven by solar, ...

A new paper in the journal Nature Communications finds that a global irreversible solar tipping point may have passed where solar energy ...

In India, the National Solar Mission's combined use of public procurement, waivers of inter-state transmission fees, grid expansion and specific subsidy schemes for rooftops and riverbanks resulted ...

The Bell Labs dis-covery "tipped" PV into the real applications arena from its position for many years as merely a research curiosity. The world markets in PV have been growing, intensified by the energy ...

The results of the grid parity analysis show that distributed solar PV projects have reached a tipping point of cost-effectiveness, when solar PV can ...

# What is the tipping point of a photovoltaic support

A new study predicts that solar power will become the world's dominant energy source before 2050, even without aggressive climate policies. ...
